

1 **ABSTRACT OF THE DISCLOSURE**

2 A pot includes a hollow body and a lid detachably mounted on the hollow body
3 to cover the open end. There is at least one first magnet annularly embedded in the
4 peripheral edge defining the open end of the hollow body. Two second magnets are
5 diametrically embedded in a bottom face of the lid. When only one second magnet is
6 attracted by the at least one first magnet, the lid is able to move relative to the hollow
7 body to allow the lid to be inclined relative to the hollow body and when both second
8 magnets are attracted by the at least one first magnet, the lid is immovable relative to the
9 hollow body so as to close the communication between the open end and the outlet.
